This tool is an example of a Petri net simulator, which is a general purpose graphical network modeling tool. It is designed to model information flow in a way that allows the user to simulate and analyze systems. In this tool, modeling and simulation are done with the help of workflow nets. Petri Net Description: - When comparing Petri nets to workflow nets, the key difference is that Petri nets use tokens that have a limited capacity whereas workflow nets use tokens that have unlimited capacity. - Petri nets are designed to model and analyze information flow in a particular scenario. - Petri nets can be used to model supply chains and production processes. - Petri nets are used to model and analyze information flow in a particular scenario. - A Petri net consists of a set of places, a set of transitions, a set of initial tokens and a set of final tokens. - The main goal of a Petri net is to accurately model the flow of information in a scenario. - When a token is placed in a place it represents a choice that can be taken by a process at that moment in time. - The size of a place in a Petri net defines the number of tokens that can be placed in that place. - The transitions are links between two places. - A transition can be fired from a place when a token is placed in that place. - The initial and final states of a Petri net define whether the Petri net can be started or stopped. - An initial token is defined as the token placed in the initial state of the Petri net. - A final token is defined as the token placed in the final state of the Petri net. - If there are no tokens in a place, it is marked as an invisible token. - A transition can be used to fire a process or cancel the firing of a process. - A state in a Petri net represents a state of the process. - A transition can only fire a process once. - If the process is fired, the tokens in
